

What does the Domain Names search API include for Simple Resellers?

- 2022-12-15 - Domain Resellers

The API includes PHP code, which can be embedded in the resellers' website, from which visitors will be able to search for domain names (they will not be able to register automatically their domain, since this is a Gold Reseller's privilege). Below are the steps reseller's customers will follow to register a domain name :

- Domain name search.
- If the domain is available, they may continue to its registration by filling out the registration form. The registration details will be sent to the reseller by email.
- When the reseller receives the registration email, the reseller should go to Papaki and register the domain under his or her account, with the customer's owner details.
