

I am a Reseller of Papaki. How can I install the API on my site?

- 2022-12-15 - Domain Resellers

1) Download the API from your Control Panel.

Log in your Control Panel of Papaki and go to ["Resellers Settings"](#). Download the API that suits you best, depending on your Reseller type.

- For Simple Resellers: Download the API php or joomla API.

- For Gold Resellers: Download the API php or the WHMCS module (or if you want, create your own interface for searching/registering and administrating domains, using only the json Requests and Responses being provided for communication with Papaki).

2) Install the API to your site.

Follow the available [useful directions](#) for installation. It's needed to create your own API key (from the "Resellers Settings") in order to use it in the code, according to the [installation instructions](#). You may also [contact](#) our Technical Department for any questions.
